Fireflies Commitments Prototype Audit

Audit date: October 31, 2026

Scope: syntax-error diagnosis, repair, core commitment flows, resolution semantics, filters, and responsive layout.

Executive summary

The commitment-management prototype is suitable for a capstone demo after a small startup configuration repair. The commitment application itself typechecks, builds, starts, renders, and passed the tested core interactions. The full workspace build remains blocked by unrelated errors in the slide-deck package.

A. Root cause

The reported “SyntaxError: Illegal return statement” was not reproduced in the current checkout. The directly reproducible failure was Vite startup/config loading: “Cannot read directory ../../../../..: Access is denied” followed by “Could not resolve .../artifacts/fireflies-commitments/vite.config.ts”.

The failure occurred before application code loaded. It was caused by Vite’s default config bundler in the current Windows environment, not by App.tsx or a malformed React component.

Affected file: artifacts/fireflies-commitments/vite.config.ts. No application-source line produced the startup failure.

B. Changes made

Updated artifacts/fireflies-commitments/package.json to add --configLoader runner to the dev, build, and serve scripts. No UI, routes, task data model, interaction logic, or resolution semantics were changed.

C. Verification results

Check	Result	Evidence / notes
Commitment app typecheck	**PASS**	tsc -p tsconfig.json --noEmit completed successfully.
Commitment app production build	**PASS**	Vite transformed 1,684 modules and generated dist/public.
Full workspace typecheck/build	**FAIL**	fireflies-commitments-deck has missing .sdm modules and LoadedSlide type errors.
Documented dev startup	**PASS**	Vite started at http://localhost:5173/.
Browser console/page errors	**PASS**	0 console errors and 0 page errors after reload.
Task creation	**PASS**	Created “QA prototype follow-up”; it appeared under Manual tasks.
Required-field validation	**PASS**	Empty title submission displayed the required-title error.
Ownership confirmation	**PASS**	Candidate changed to Open and candidate count decreased from 2 to 1.
Done status	**PASS**	Task changed to Done and appeared in Resolved outcomes.
Blocked status	**PASS**	Dependency was required; task showed Blocked · unresolved.
Deliberate drop	**PASS**	Drop dialog opened; final state was Deliberately dropped, not Done.
Reassignment request	**PASS**	Task entered Awaiting acceptance and remained unresolved.
Reassignment acceptance	**PASS — simulated**	Old instance became Reassigned and linked instance became Open.
Filters/counts	**PASS with caveat**	Candidate, unresolved, resolved, and all-state counts updated from underlying state.
Responsive layout	**PASS**	No horizontal overflow at 1440px, 768px, or 390px; primary action remained visible.

D. Product-semantic findings

The implementation treats Done, Deliberately dropped, and Reassigned as resolved. Candidate, Open, Blocked, and Awaiting acceptance remain unresolved. Accepted reassignment closes the original instance as Reassigned and creates a linked Open instance.

Filter terminology differs from the requested wording: the UI uses Candidates, Open / blocked / transfer, and Resolved outcomes instead of Needs Confirmation, Open, and Resolved. The tested counts were consistent with the implemented semantics.

E. Known limitations

Reassignment acceptance is simulated in one browser; there is no real second-user identity, backend, authentication, notifications, or external integration. Mobile overflow and primary-action visibility were checked, but mobile-specific dialog behavior was not separately tested. Git status could not be verified because the .git directory is not a valid repository.

F. Submission recommendation

Suitable only with a disclosed limitation. The commitment prototype is ready for a live capstone walkthrough, provided the demo explains that reassignment acceptance is simulated and the full workspace build is blocked by the unrelated slide-deck package.
